FEEDBACK

CADETSM BRAF MUTATION DETECTION ASSAY/TEST

EARLY BLADDER CANCER (TCC/UC) DETECTION

Over 80,000 dogs will be diagnosed with bladder cancer this year. Is your dog at risk? Thanks to a simple at-home test you can detect bladder cancer earlier - while there's still time to act.

The CADETSM BRAF Mutation Detection Assay offers a forensic level of detection, so sensitive that it can detect bladder cancer (also known as TCC/UC) with as few as ten mutant-bearing cells in the urine sample. Combined with specially formulated urine preservation and DNA extraction process, the CADETSM BRAF Mutation Detection Assay detects the presence of TCC/UC up to 4 months before any clinical signs of disease are present - and all with a simple free-catch urine sample. Results will be delivered to you within two weeks of receipt of urine to laboratory.

Detecting cancer earlier before symptoms even present can dramatically change prognosis and long-term survival of your best friend.

Choose from one of the following products:

- 1) **Annual Screening Subscription** - Receive all the materials needed to test one dog 3 times a year, plus free shipping and handling.
- 2) **Breeder Pack** - Test multiple dogs for reduced rate and free shipping and handling when sending urine samples to the laboratory at the same time.

ANNUAL SCREENING SUBSCRIPTION PACKAGE CADETSM BRAF MUTATION DETECTION ASSAY/TEST

(Early Detection of TCC/UC)

Test your dog 3 times a year and detect TCC/UC cancer up to 4 months before symptoms present - all with an easy free-catch urine sample that can be conveniently collected at home.

BREEDER PACK

Test multiple dogs at the same time for a reduced rate, plus free shipping and handling.

Breeder Pack* includes:

- All materials for collecting and shipping urine samples
- FREE shipping to lab
